OUTLINE

- I. Measurements of electronic and nuclear recoils with a high signal-to-noise and high spatial resolution detector
- II. Implications for a directional low mass WIMP search

R&D using a CCD-GEM based detector

Nguyen Phan (PhD student, UNM)

high S/N, high spatial resolution

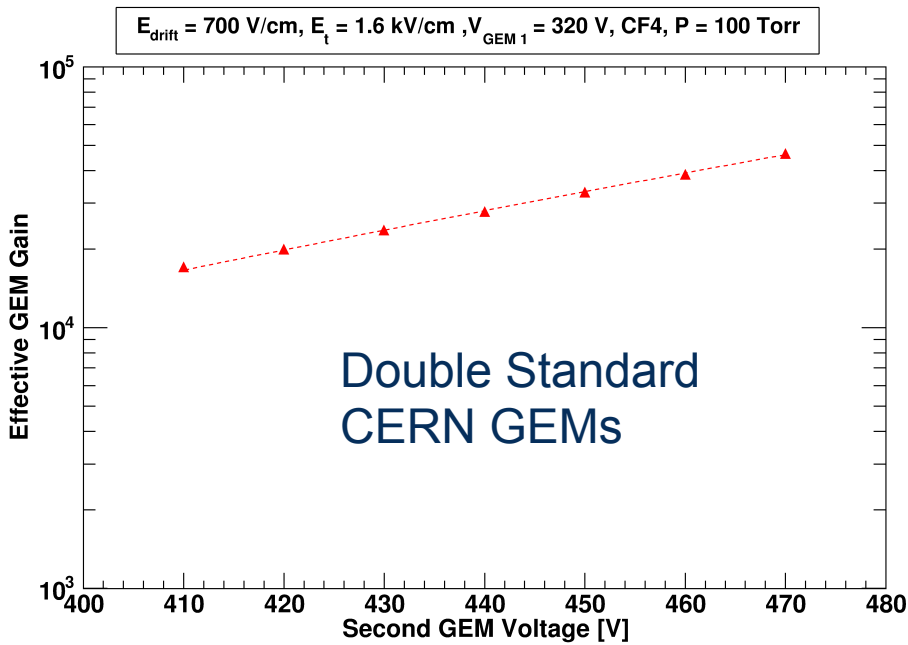

GEMs (Gas Electron Multipliers)

- $\sim 50 \text{ }\mu\text{m}$ thick, $140 \text{ }\mu\text{m}$ hole pitch.
- Typical dimensions: $10 \text{ cm} \times 10 \text{ cm}$.
- $\Delta V = 300 - 500 \text{ V} \rightarrow$ electric fields inside holes (10 's kV/cm).
- Electrons drift into holes and undergo collisional avalanche \rightarrow release of secondary electrons and scintillation light.
- Charge gains of 10^7 possible with multiple GEMs cascaded, but **strongly** dependent on both the type of gas & pressure.
- THGEMs: ~ 10 x in dim., robust, low pressure, high gains.

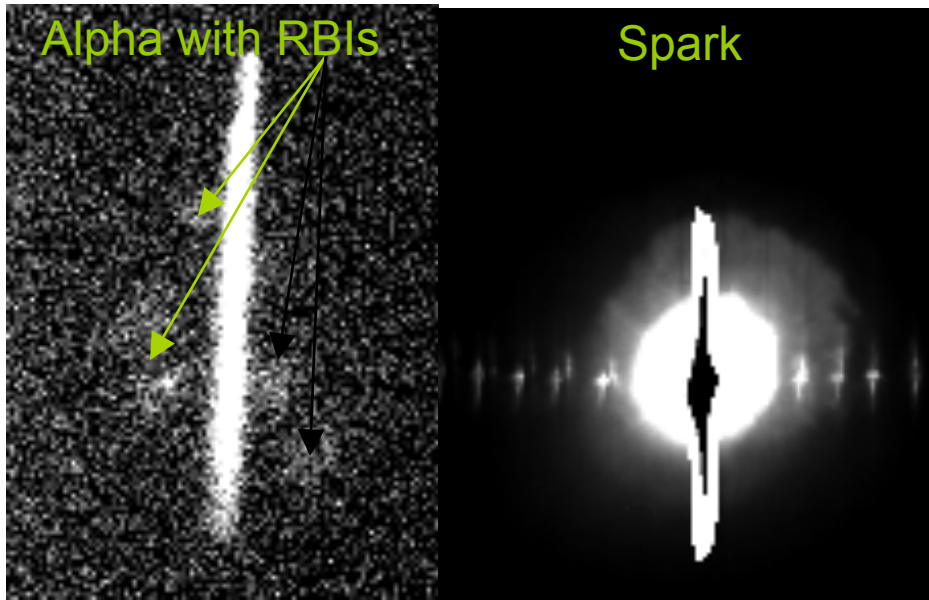

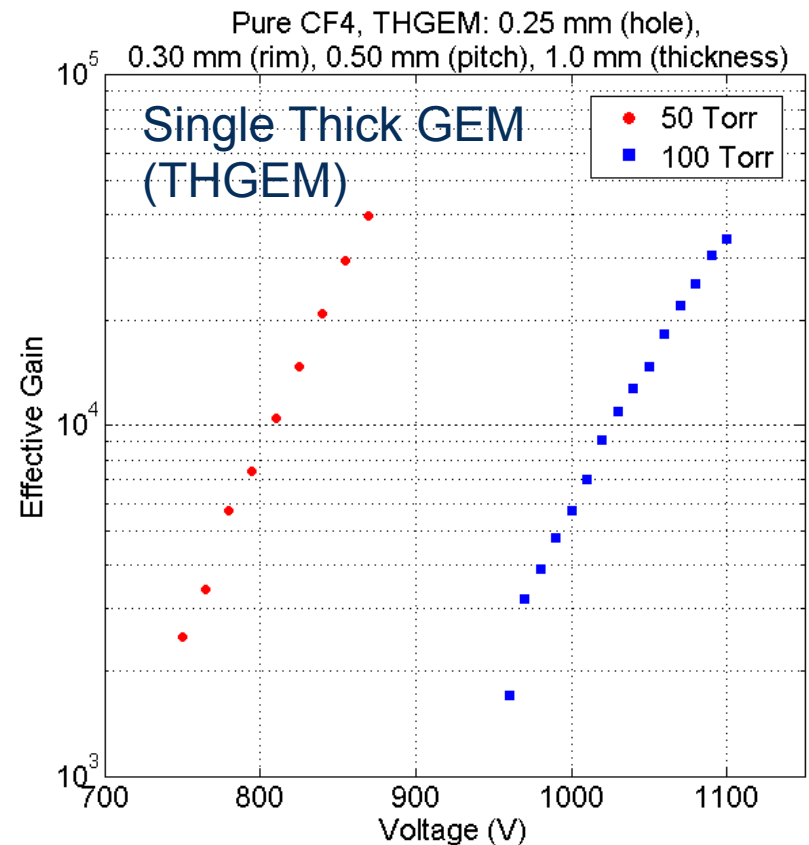

GEM Gas Gain in CF4

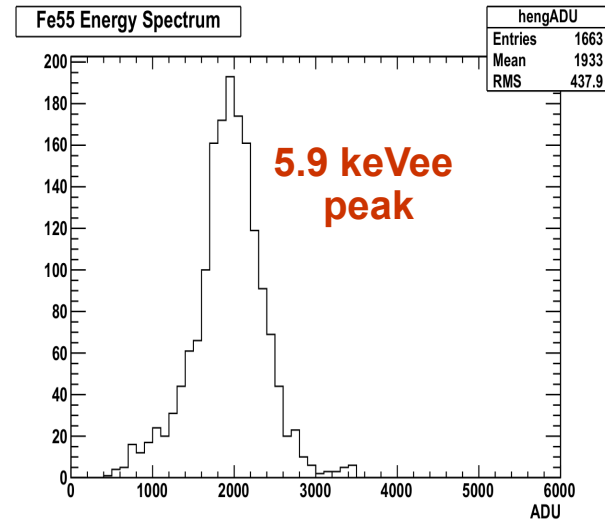

- Max. stable effective gain (α 's):

- 100 Torr CF4
 - » 2 GEMs: 40,000
 - » 3 GEMs: 200,000
- 75 Torr CF4
 - » 2 GEMs: 20,000
 - » 3 GEMs: 40,000

Energy Calibration with Fe-55

We calibrate using both the electron and light signal - **To our knowledge, this is the first optical Fe55 spectrum obtained in low pressure CF4.**

Fe55 Energy Spectrum

hengADU	
Entries	1809
Mean	2096
RMS	742.3

Energy spectrum of 16x16 binned Fe55 tracks.

Top Right: Fe55 tracks at 16x16 binning (on-chip) and 380,000 effective gain.

Bottom Right: Fe55 tracks at 6x6 binning (on-chip). Smaller image is binned 4x4 in software. Gain of 200,000 (same for gamma and neutron runs).

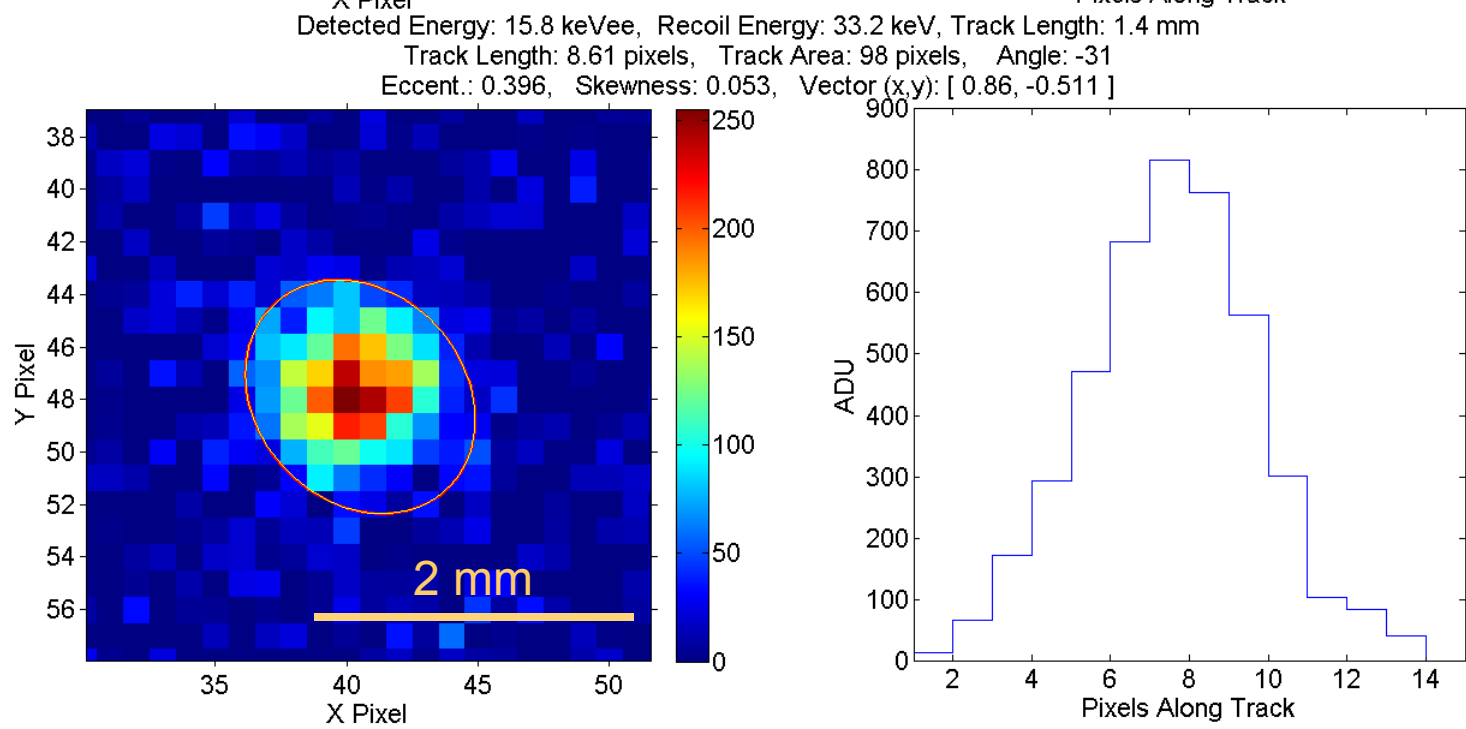

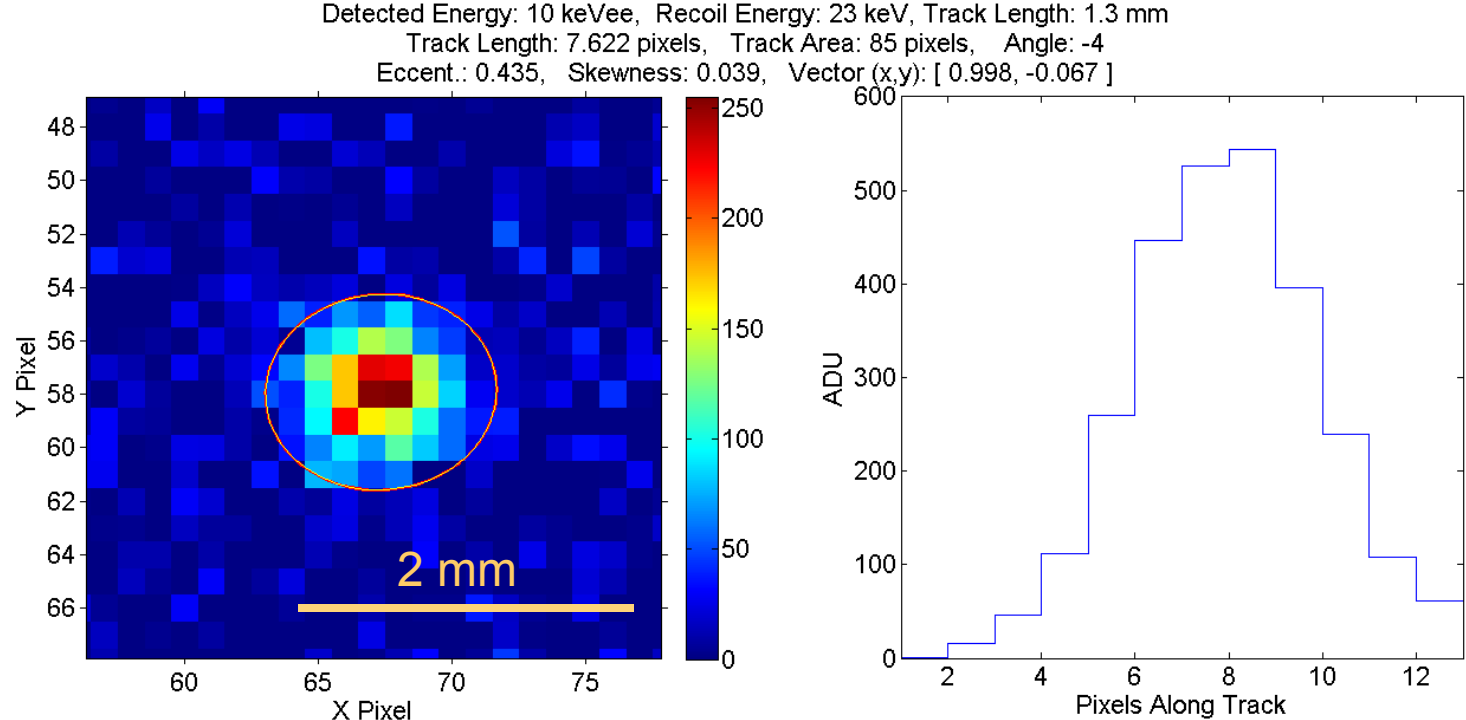

Neutron (Cf-252) & Gamma (Co-60) Runs

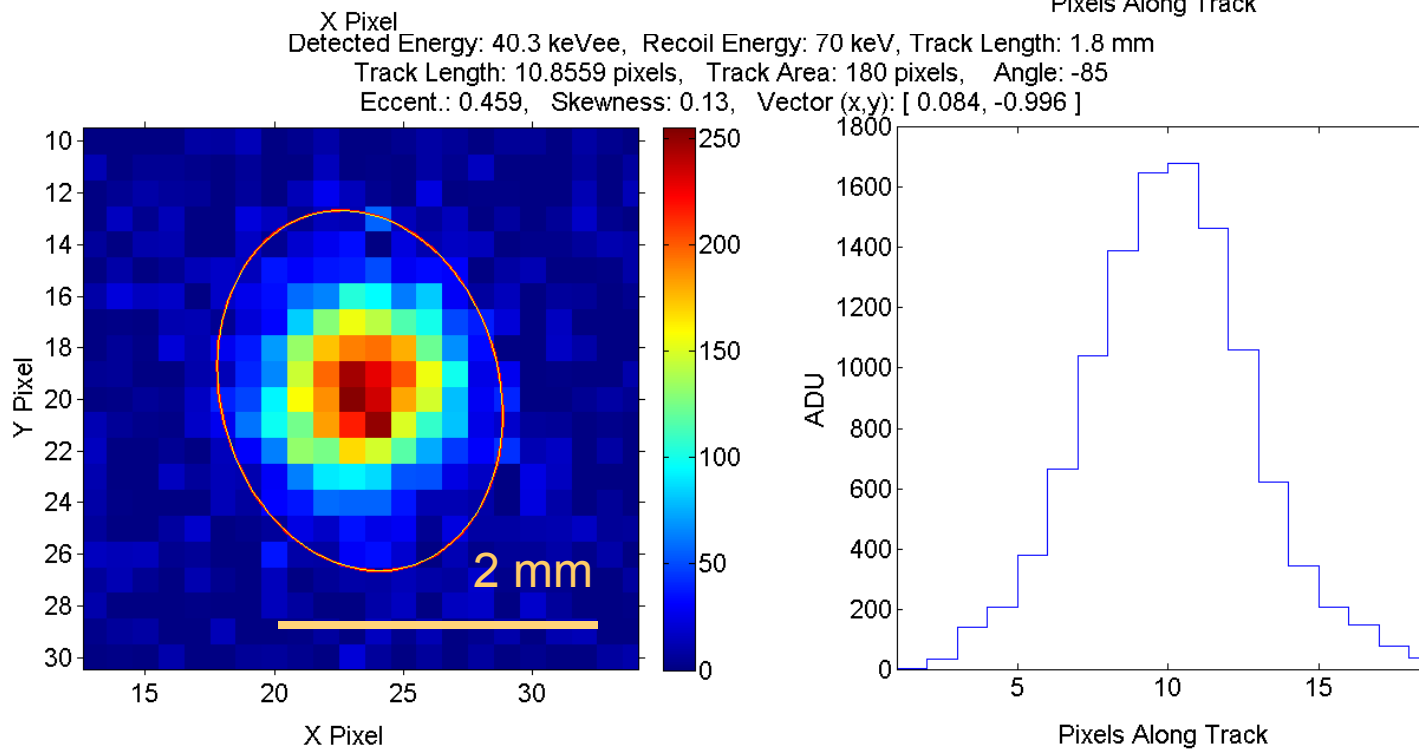

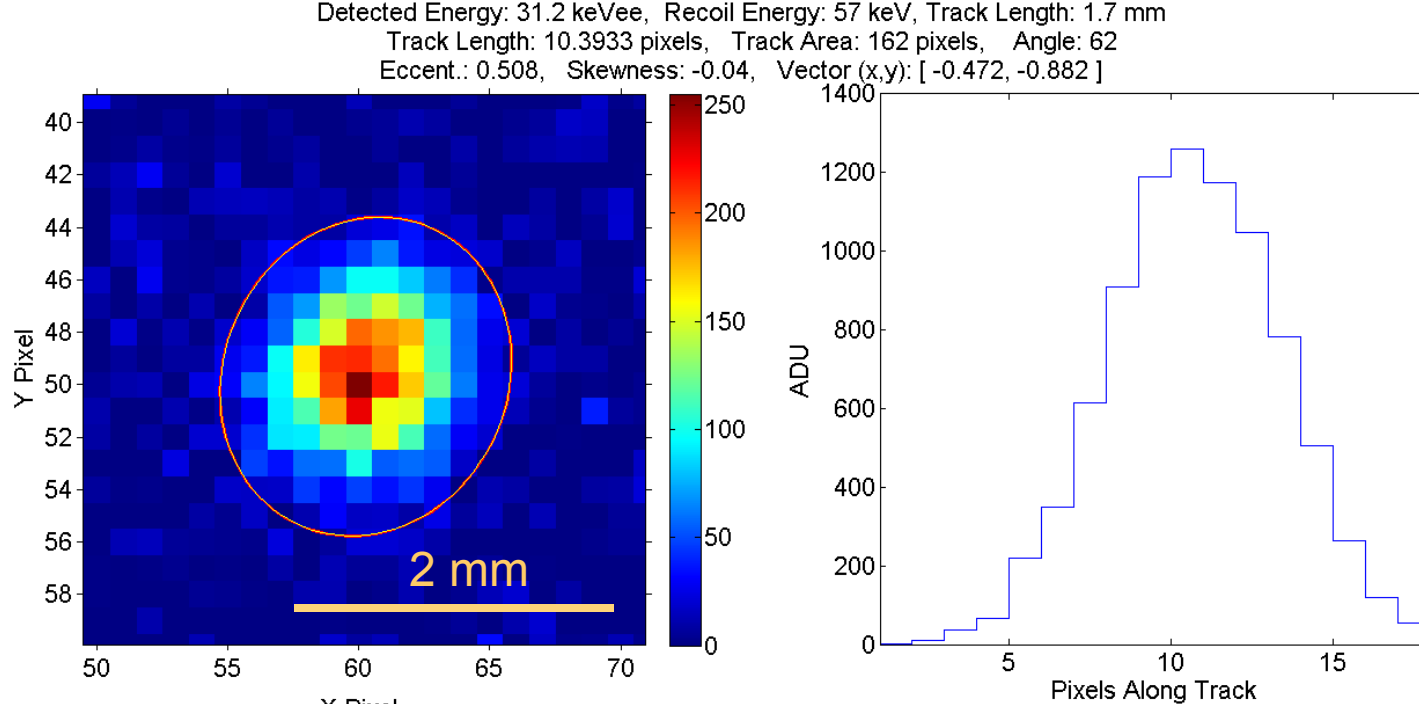

Experimental Parameters

- 3 standard copper CERN GEMs (7 cm x 7 cm).
- Pressure: 100 Torr pure CF₄
- Effective gain: ~200,000
- Diffusion: $\sigma=350$ μm
- FLI back-illuminated CCD (peak QE ~ 93%, read-noise 10 e- rms)
- 6 x 6 on-chip binning, 5 sec. sequential exposures.
- Energy resolution: 35% (FWHM) at 5.9 keVee

Nuclear Recoils

Nuclear Recoils

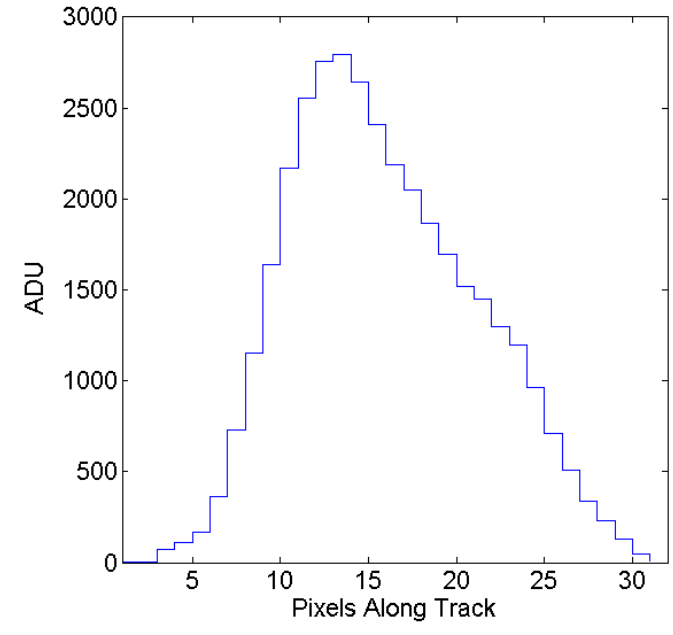

Nuclear Recoils

Detected Energy: 61.1 keVee, Recoil Energy: 97.6 keV, Track Length: 1.9 mm
Track Length: 11.5817 pixels, Track Area: 217 pixels, Angle: 61
Eccent.: 0.636, Skewness: 0.23, Vector (x,y): [0.486, 0.874]

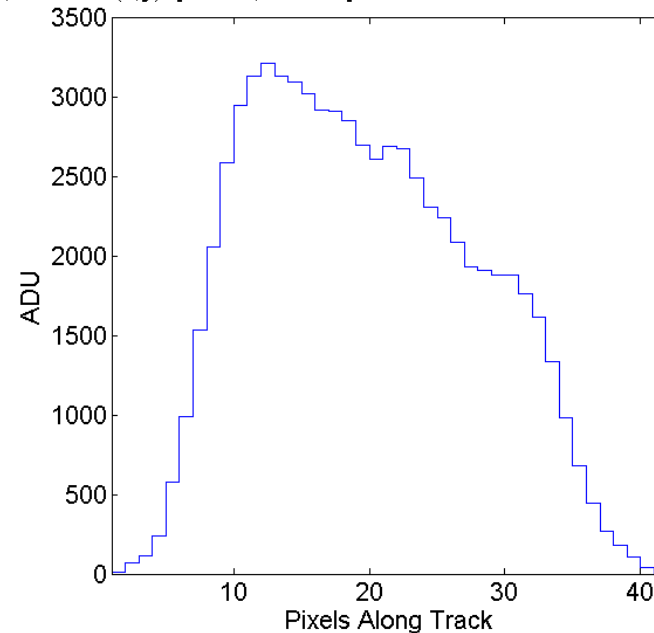

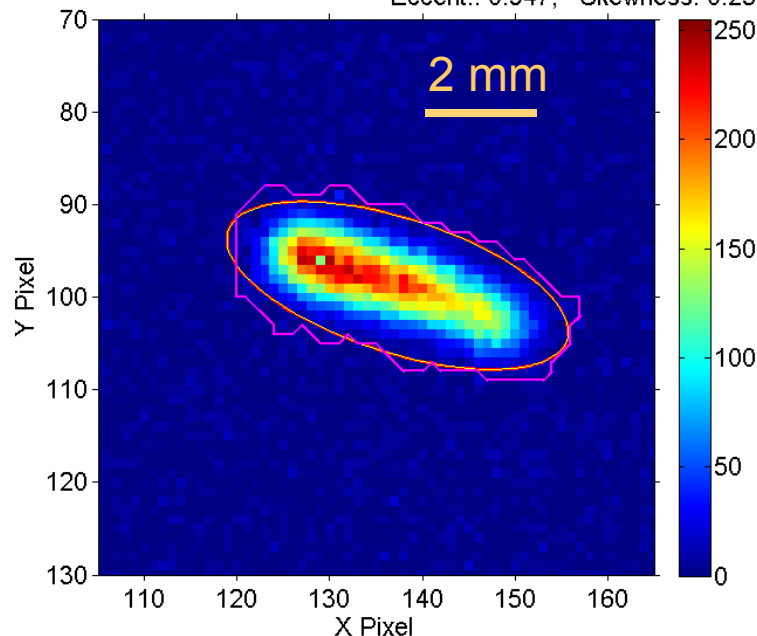

Detected Energy: 129.3 keVee, Recoil Energy: 177.8 keV, Track Length: 3.5 mm
Track Length: 20.849 pixels, Track Area: 400 pixels, Angle: 62
Eccent.: 0.86, Skewness: 0.341, Vector (x,y): [0.47, 0.883]

Nuclear Recoils

Detected Energy: 254.5 keVee, Recoil Energy: 305.6 keV, Track Length: 5.3 mm
Track Length: 32.0609 pixels, Track Area: 560 pixels, Angle: -18
Eccent.: 0.947, Skewness: 0.259, Vector (x,y): [0.949, -0.315]

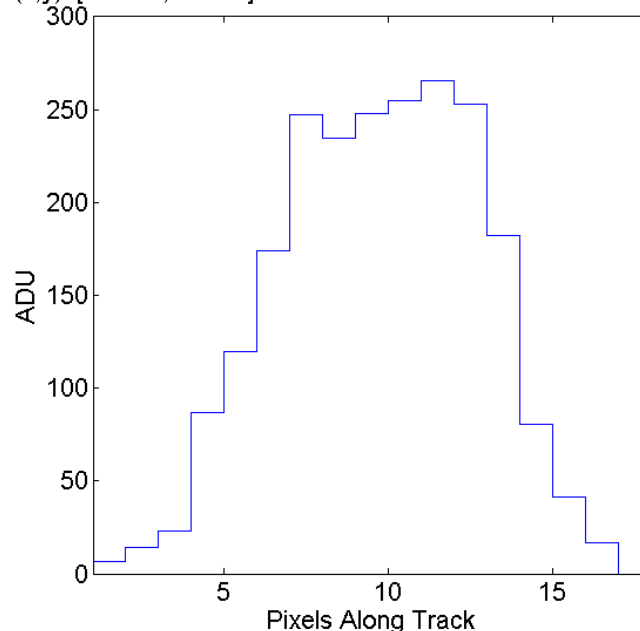

Detected Energy: 302.4 keVee, Recoil Energy: 350.7 keV, Track Length: 5.4 mm
Track Length: 32.5429 pixels, Track Area: 684 pixels, Angle: 19
Eccent.: 0.938, Skewness: 0.346, Vector (x,y): [0.946, 0.324]

Electronic Recoils

Detected Energy: 8.2 keVee, Track Length: 1.9 mm
Track Length: 11.6287 pixels, Track Area: 111 pixels, Angle: -83
Eccent.: 0.716, Skewness: -0.15, Vector (x,y): [-0.129, 0.992]

Detected Energy: 12.4 keVee, Track Length: 4.3 mm
Track Length: 26.0947 pixels, Track Area: 179 pixels, Angle: 39
Eccent.: 0.95, Skewness: -0.492, Vector (x,y): [-0.772, -0.636]

Electronic Recoils

Detected Energy: 13.3 keVee, Track Length: 4 mm
Track Length: 23.8567 pixels, Track Area: 168 pixels, Angle: -74
Eccent.: 0.938, Skewness: -0.126, Vector (x,y): [-0.269, 0.963]

Detected Energy: 21.4 keVee, Track Length: 5.7 mm
Track Length: 34.2166 pixels, Track Area: 365 pixels, Angle: 61
Eccent.: 0.907, Skewness: 0.194, Vector (x,y): [0.479, 0.878]

Electronic Recoils

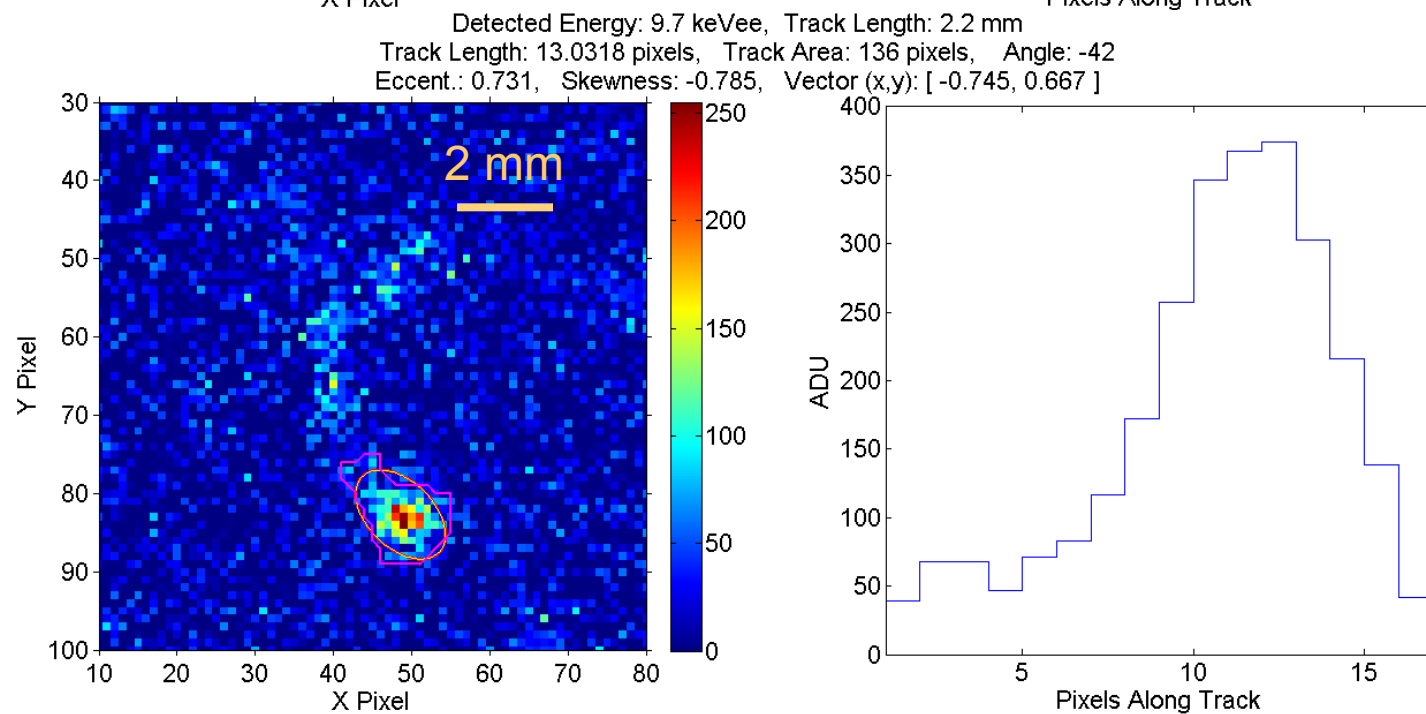

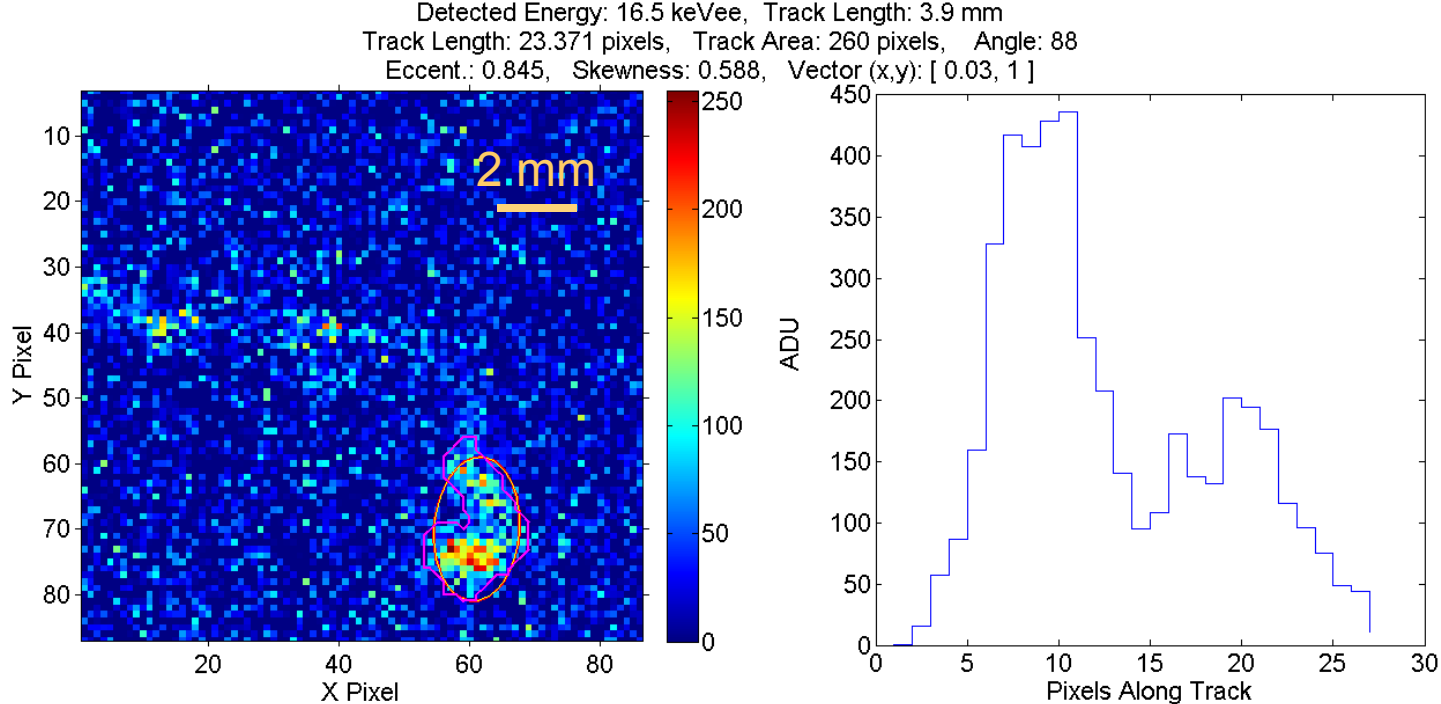

Detected Energy: 16.5 keVee, Track Length: 5.3 mm
Track Length: 31.7599 pixels, Track Area: 266 pixels, Angle: 78
Eccent.: 0.939, Skewness: 0.387, Vector (x,y): [0.2, 0.98]

Detected Energy: 27.2 keVee, Track Length: 6.5 mm
Track Length: 39.0339 pixels, Track Area: 440 pixels, Angle: 50
Eccent.: 0.836, Skewness: -0.357, Vector (x,y): [-0.649, -0.761]

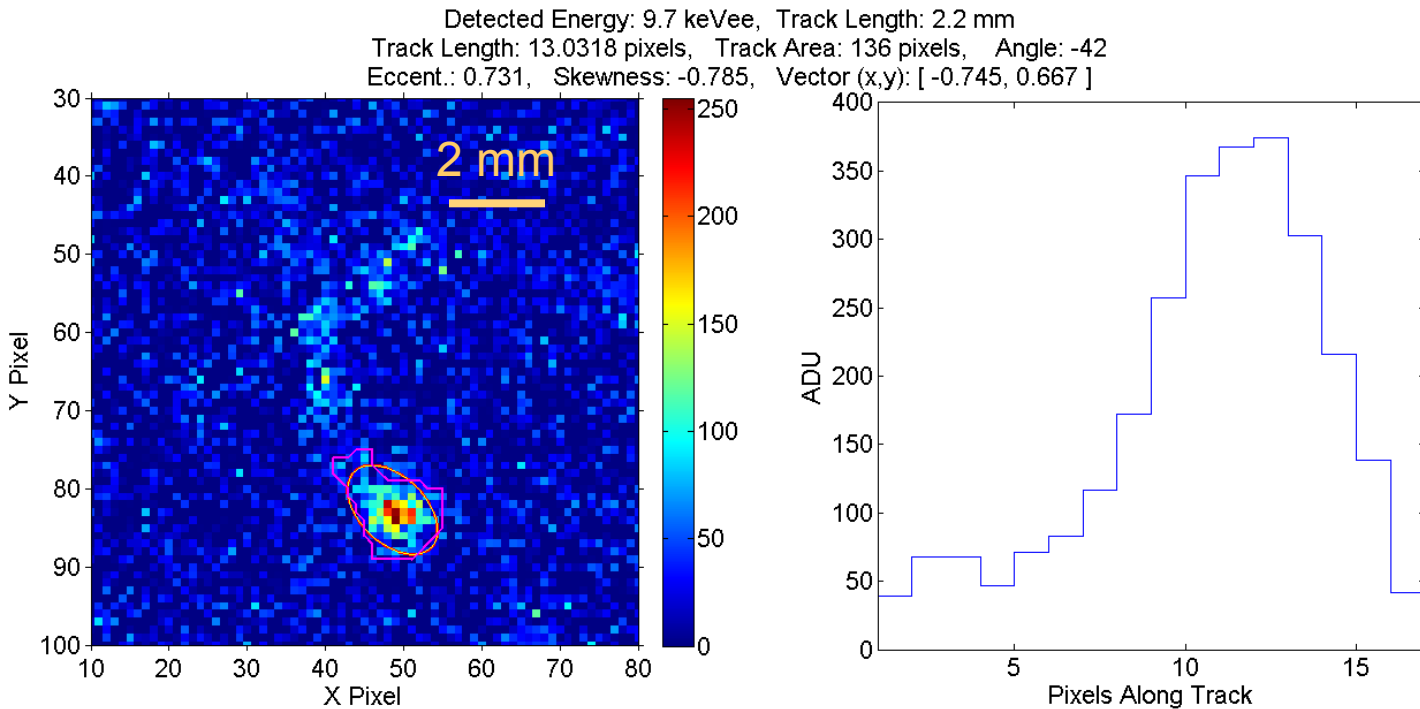

Electronic Recoils

Discrimination and Directionality

Discrimination

- Electronic recoils have **small** dE/dx with **large** fluctuations \rightarrow low S/N leads to confusion with nuclear recoils

A ~10 keVee electron or a ~25 keVr F recoil??

Good Discrimination requires high S/N

- For discriminating between electronic and nuclear recoils down to the lowest possible energies, high S/N is critical. 3D tracks would also help.
- Lower diffusion and pressures would also help, but these are more critical for finding directionality in nuclear recoils.
- Here's the data...

Raw Data: Before any analysis cuts are applied:

Direct interaction of high energy photons, cosmic rays, neutrons, etc, in the CCD sensor.

CCD Event Cuts

Standard deviation of pixels in a given track.

Ratio of total energy (keVee) to the total number of pixels.

Neutron Run Data

After cuts to remove CCD events

The minimum track length agrees with the expected length for a point-like track with ~ 350 μm diffusion (sigma) (810 μm FWHM).

Overlay of neutron run data with gamma run data.

Events from gamma run passing the electronic recoil cuts

Electronic Recoil Cuts

LR: Peak charge to track length ratio

Gamma Run Events:

27,644 (no cuts)
 25,763 (CCD events cut)
 79 (all cuts)

Neutron Run Events:

55,013 (no cuts)
 51,137 (CCD events cut)
 9,024 (all cuts)

Energy spectrum of nuclear recoils post analysis cuts

Discrimination threshold: ~10 keVee (~25 keVr, Hitachi).

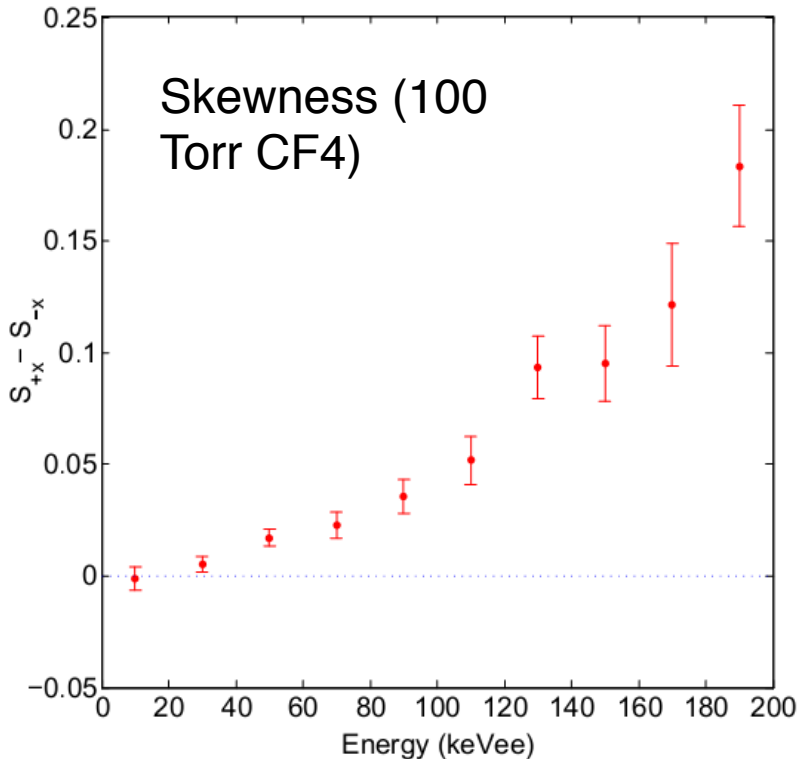

Directionality

Our analysis takes all events that are classified as neutrons (above our threshold of 25 keVr) and determines their directionality. This involves:

1. Determining the minor and major axes (their length and orientation)
2. Projecting the pixels in the track along the major axis and determining its skewness (head-tail)

For minor/major Axis length Ratio $AR \sim 1$, directionality, as determined in this way, is lost. In fact, correct skewness may still exist in the diffused blob, but other algorithms should be used to quantify it.

Head-tail

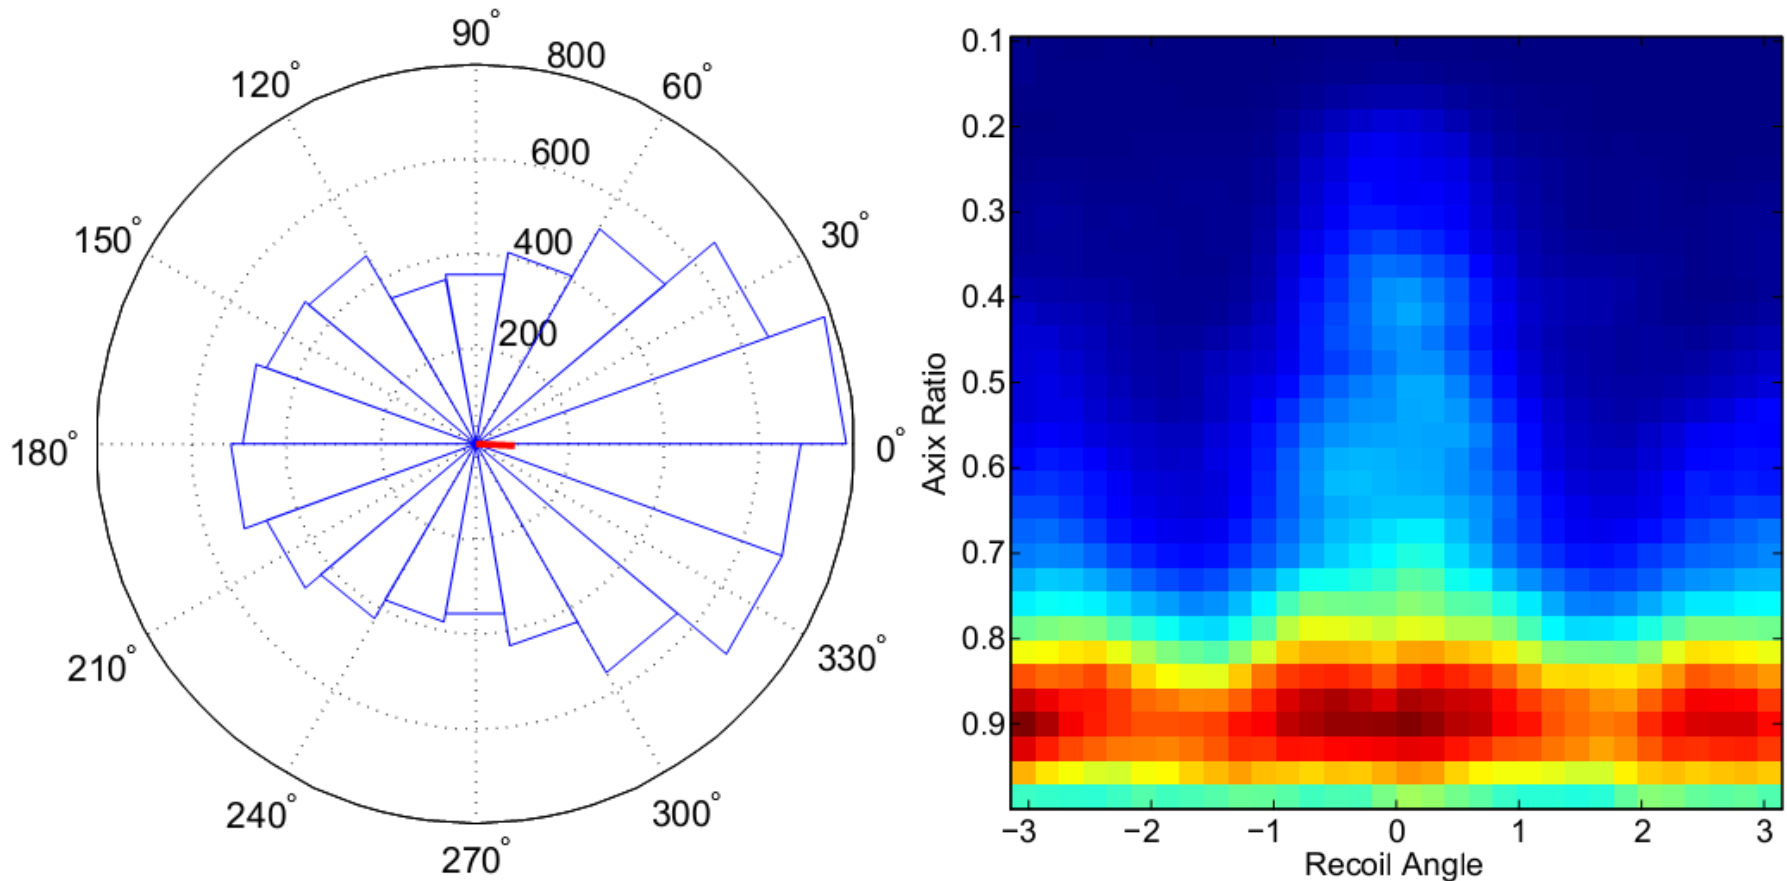

$$s = \frac{\mu_3}{\mu_2^{3/2}}$$

μ_2 and μ_3 are the 2nd and 3rd central moments of the light distribution.

Head-tail measured down to ~55-60 keVr. It is even better because ~30% of our data consists of scattered neutrons.

Note that no assumption is made of neutron direction in this analysis.

2D Vector Directionality

Circular histogram of all events classified as nuclear recoils (>25 keVr):

- Red line segment represents the magnitude and direction of the mean resultant vector.
- Antipodal peak due to incorrect assignment of skewness.
- Uniform component due to ambiguity in major axis of very round tracks and scattered neutrons (when AR is close to 1)

Number of Events for Rejection of Isotropy

- Number of events, N , found using Monte Carlo and modified Rayleigh test.

$$V = R \cos(\phi_N - \phi_0)$$

Axis Ratio	90% CL	95% CL
1.00	283	460
0.95	234	400
0.90	150	248
0.85	92	150
0.80	50	84
0.75	35	56
0.70	25	41
0.65	18	31
0.60	15	25
0.55	11	18
0.50	10	17
0.45	8	13

Table 1: The number of events, N_{tot} , needed to reject uniformity at 90% and 95% confidence levels for different cuts on the axis ratio prior to making that cut. The last column gives the number of events in the data set that have an axis ratio equal to or less than the value in the corresponding row.

Axis Ratio	90% CL	95% CL
1.00	283	460
0.95	257	439
0.90	211	349
0.85	180	293
0.80	137	230
0.75	126	201
0.70	113	185
0.65	101	174
0.60	105	174
0.55	100	163
0.50	120	203
0.45	126	205

II. Implications for a directional low mass WIMP search

Ms. CYGNUS-Lite??

CYGNUS 2013
4th International Workshop on Directional Dark Matter Detection

10 - 12 June 2013,
Oarks Canal Park Hotel,
Toyama, Japan

Scientific Program

- Technical progress on direction sensitive detectors
- Data analysis (2D/3D track reconstruction, background rejection...)
- Sense recognition: analysis strategies & measurements
- Experimental results from directional prototypes
- Theoretical studies
- Dark matter halo dynamics
- Related activities

International Organizing committee

- James Beata (Brer Mason College, USA)
- Isabelle Camarero (CEA Saclay, France)
- Alex Green (U. of Nottingham, UK)
- Yoriko Hasegawa (U. of Zaragoza, Spain)
- Dimitri Lyubchik (University of New Mexico, USA)
- Frédéric Mayor (EPSC, Geneva, France)
- Katsuro Mauchi (Kobe University, Japan)

II. Implications for a directional low mass WIMP search

Can we use the results from this work to make a case study for **directional** low mass WIMP searches?

The experimental parameters critical to our results in 100 Torr CF4 are:

1. high S/N
2. Low diffusion ($\sim 0.4\text{mm}$)
3. High spatial resolution

The first enabled excellent discrimination down to 10 keVee, the second enabled directionality at $\sim 55\text{keVr}$. *In 100 Torr CF4 the latter corresponds to F tracks with $R\sim 0.6\text{mm}$. We'll use this in the following.*

The CDMS Low Mass WIMP *

* We will assume a SI LMW

- > The A^2 gain is offset by a steepening spectrum when $E_{\text{threshold}}$ is imposed.
- > Requiring directionality further exasperates this.

For this study lets require that the $E_{\text{threshold}}$ is where directionality “turns on”. In our work this corresponds to a $R = 0.6\text{mm}$ (with $\sigma_{\text{diff}} \sim 0.4\text{mm}$).

In the plot on the next page we **maximize the interaction rate** above $E_{\text{threshold}}$ in a m^3 volume by varying the **pressure** for each **target gas**

WIMP mass = $8.6 \text{ GeV}/c^2$, $\sigma_{\text{WP}} = 1.9\text{e-}41 \text{ cm}^2$

WIMP mass = $8.6 \text{ GeV}/c^2$, $\alpha_{\text{WP}} = 1.9\text{e-}41 \text{ cm}^2$

WIMP mass = $8.6 \text{ GeV}/c^2$, $\sigma_{WP} = 1.9e-41 \text{ cm}^2$

What about the angular spectra?

Agrees with Billard et al. PLB 691 (2010)

...and Straggling? *

* Here we used SRIM to generate 1.2 mm directional recoils of F and He, which were then diffused ($\sigma=0.4\text{mm}$) and run through our analysis. S/N was set high.

Limits in 1 yr for 1 m³

Summary

- As a community we need to start thinking about a directional low mass WIMP search
- The experiment will necessarily involve **large volume detectors**. A few events/yr/m³ means many m³ for directionality! (see Neil's talk tomorrow)
- To achieve the goals of discrimination and directionality in this regime we need **high S/N, low diffusion and high spatial resolution**
- Some of the questions/challenges:
 - Directionality: Is there head-tail directionality down at 5-10 keVr? How many events are needed at the optimal P's for a 5 and 10 keVr, respectively?
 - Discrimination: The very low (a few keVee) energy thresholds requires much better discrimination and control of materials than we have needed thus far. Just how good and can we achieve it? (see Neil's talk tomorrow)
 - Target gases: What are optimal target gases for low pressure stable operation with the highest gas gains?
 - Low diffusion. This is critical in all our assumptions. Can we avoid negative ion drift (*)? We need higher E fields to take better advantage of this. The ability to z-fiducialize will improve this further!
 - Detectors: How many D's do we need?
 - Others
